

## **Amendments to the Specification**

Please replace paragraph [016] with the following:

[016] Our overlay network 110 makes minimal assumptions about the knowledge and support of the underlying physical network 120. Periodically, the client 102 makes a request to receive streamed data from the server ~~102~~ 101. When the server receives such a request, the server dynamically selects multiple paths to deliver the streamed data the client using paths in the overlay network. By using multiple paths as selected by the invention, the quality of service (QoS) is improved over the prior art.
